Attention: Mr. R. Weaver, Code 420

Subject: Transmittal of Addendum to AE-C Alignment
and Calibration Data Book

Gentlemen:

Enclosed herewith are 15 copies of the addendum to
the "Alignment and Calibration Data for the Atmosphere
Explorer C Spacecraft" book.

The addendum consists of sections 2.0 and 3.0 dealing
with Optical Alignment and Mass Properties, respectively.

Very truly yours,

A handwritten signature in black ink, appearing to read "S. Toth".

S. Toth
Manager
AE Project Operations

Addendum

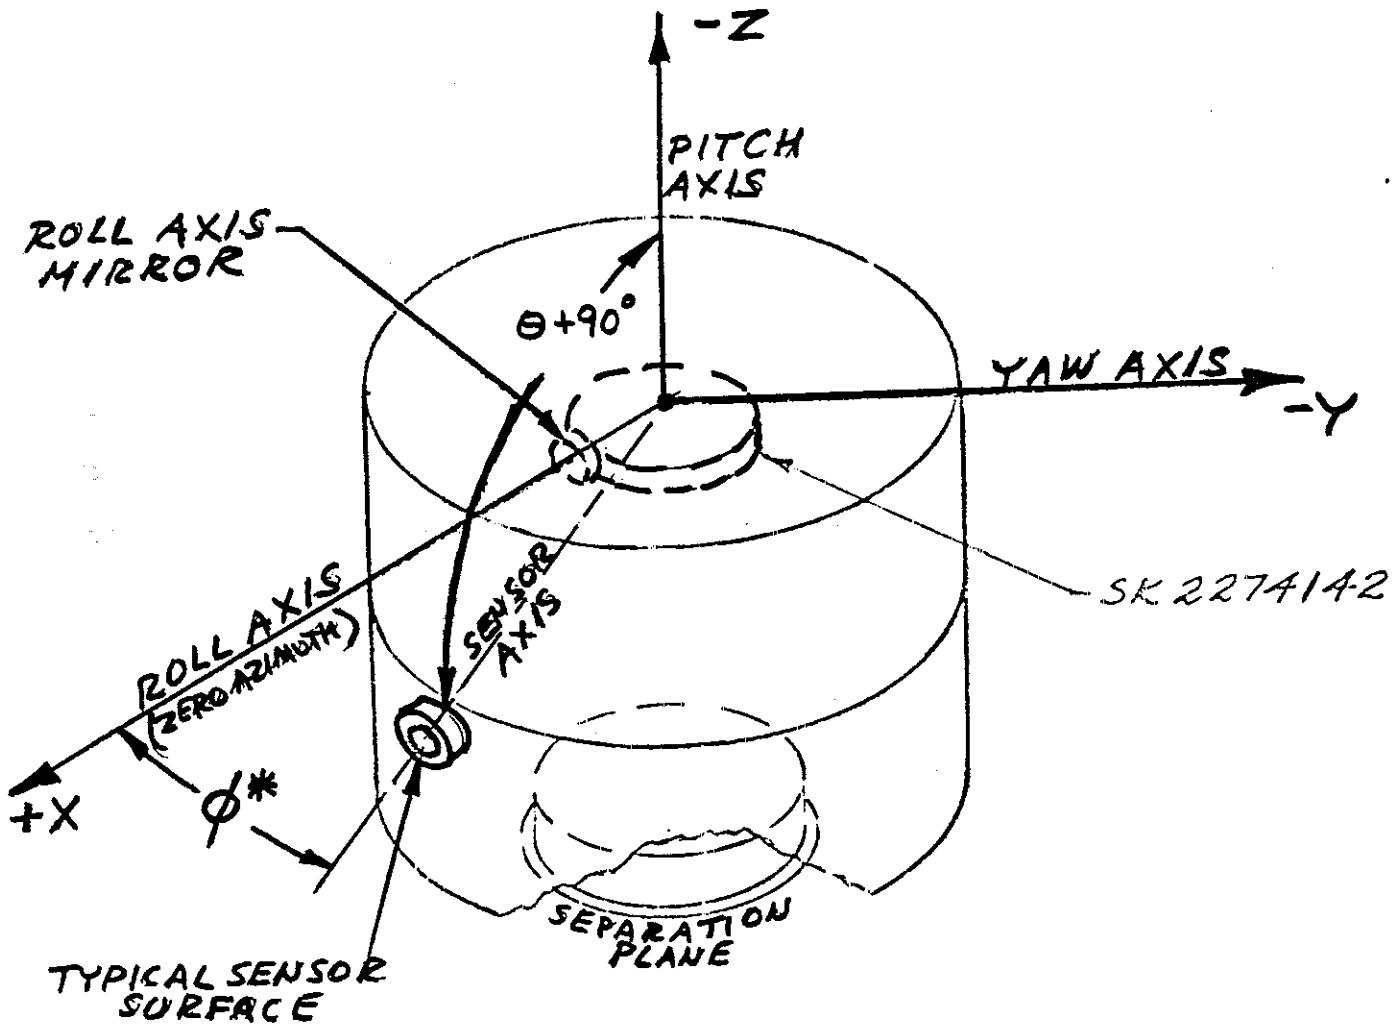

SECTION 2.0
AE SPACECRAFT "C"
OPTICAL ALIGNMENT DATA

Tables 2.1 and 2.2 provide the results of optical alignment measurements of the experiment and select black box/system reference surfaces. These measurements were taken in accordance with TP-OA-2271596 at three discrete times in the spacecraft integration and test program as follows:

17 August 1973	Pre-vibration
24 October 1973	Post-vibration
3 November 1973	Post-vibration Retest

The change in the pointing direction of the reference surface normals in the elevation and azimuth planes is provided for each of the two sets of data. The sign convention utilized for the data presentation is given in Figure 2.1.

FIGURE 2.1

ALIGNMENT DATA SIGN CONVENTION

The elevation angle θ is the angle between the MWA mounting plane and the sensor axis. The angle θ is negative when the angle between the sensor axis and the negative pitch axis ($-Z$) is less than 90 degrees. Conversely, the angle θ is positive when the angle between sensor and pitch axes is greater than 90 degrees.

The azimuth angle ϕ is the angle between roll/pitch plane ($+X, -Z$) and the plane defined by the pitch axis and sensor axis. The angle ϕ is positive when the plane defined by the pitch axis and the sensor axis is counter-clockwise of the $+X, -Z$ plane as viewed from the $-Z$ axis.

* Angle ϕ shown here is a positive angle.

SECTION 3.0

Addendum

Section 3.0 Weight, Moment of Inertia, Center of Gravity and Balance Measurements

Final measured/calculated mass properties for A. E. Spacecraft C are given in Table 3.1. Tabulations for four configurations are as follows:

- 1) OAP's empty
- 2) Launch
- 2) Beginning of Life (B. O. L.) - 373.0 lbs. fuel
- 3) End of Life (E. O. L.) - 18.0 lbs. fuel

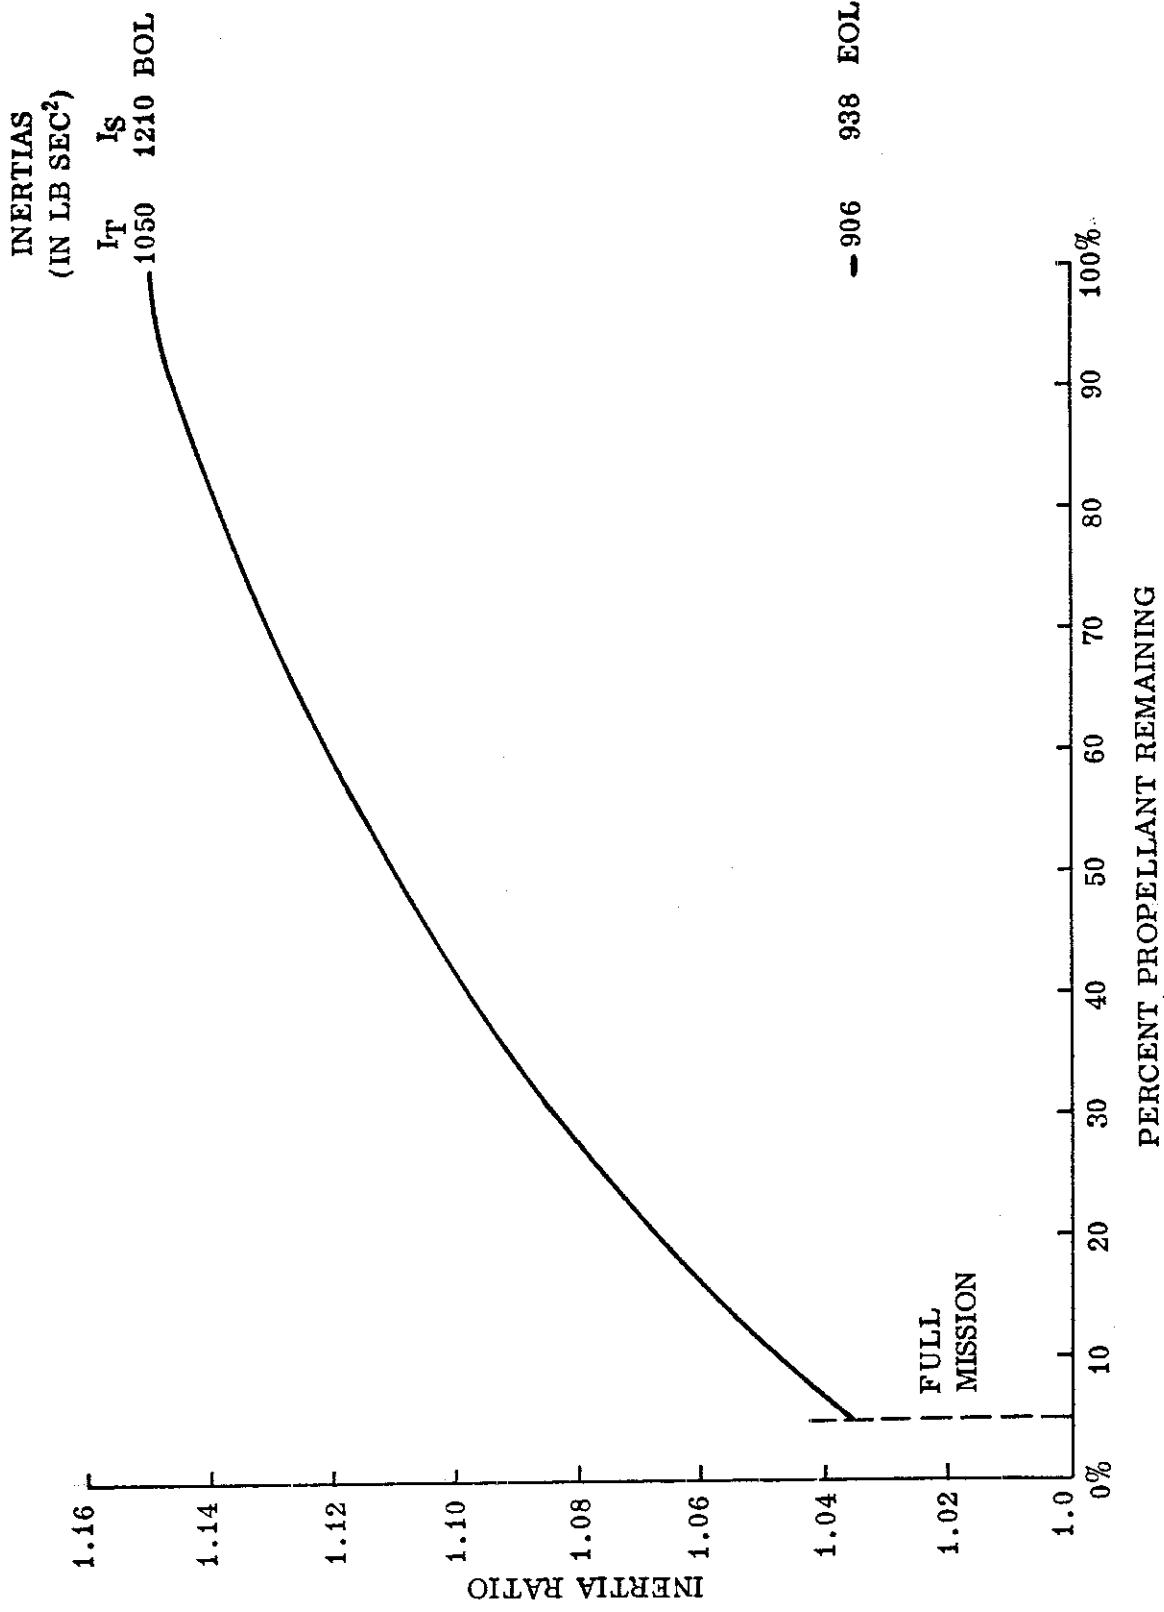

Table 3.1

AE-C MASS PROPERTIES

S/C Configuration	Weight (lbs)	\bar{X}	(inches $\times 10^3$) \bar{Y}	\bar{Z}	WXZ (lb-in ²)	WYZ (lb-in ²)	I_S (lb-in ² $\times 10^{-3}$)	$I_{LAT-MAX}$ (lb-in ² $\times 10^{-3}$)	Inertia Ratio
1 OAP's Empty	1117.3	47	5	5	--	--	--	--	--
2 Launch	1493.7	21	-15	4	504 max.	202 max.	--	--	--
3 B.O. L.	1490.3	-20	-18	6	113 max.	113 max.	537	455	1.181
4 E.O. L.	1135.3	-26	-24	8	113 max.	113 max.	399	381	1.048

3.0-2 (A)

SECTION 4.0

SECTION 5.0

COMMAND LIST

**THE COMMAND FORMAT USED FOR THE AE "C" SPACECRAFT
IS SHOWN IN FIGURE 5-1. THE SEVEN BIT ADDRESS FOR AE
"C" IS GIVEN IN BINARY AS 1101000.**

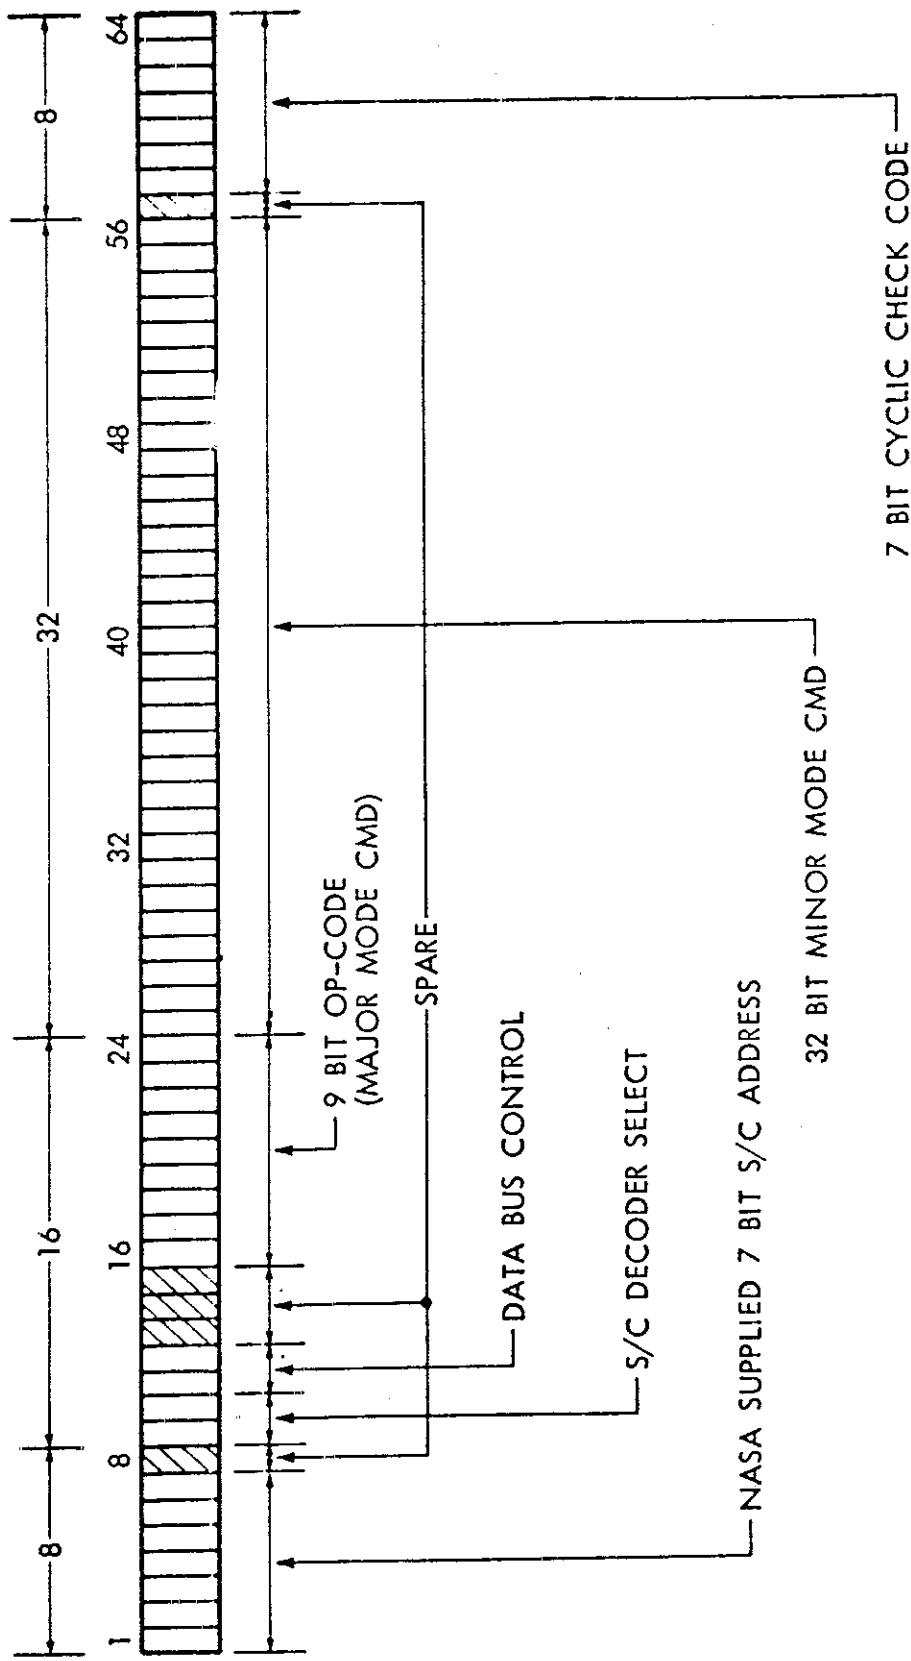

Figure 5-1. Command Word Structure - Real-Time Command

Command Word Format

The actual format of the 64-bit command word is as follows:

- ' Bits 1-7 - X'EO' - Satellite address code
- Bit 8 - Spare bit = 0
- Bits 9, 10 - Decoder select code; 01 = decoder 1, 10 = decoder 2 and 00, or 11 signified neither decoder
- Bits 11, 12 - Data bus control code; 00, 01, 10 - no minor mode data, 11 signifies minor mode data is present
- Bit 13 - Spare = 0
- Bit 14 - Spare = 0
- Bit 15 - Spare = 0
- Bits 16-24 - 9 bit OP CODE
- Bits 25-56 - 32 bit MINOR MODE DATA; these bits are all 0's if minor mode data is not included
- Bit 57 - Spare = 0
- Bits 58-64 - Cyclic code check bits

It should be noted that for all command transmissions, whether for individual 64-bit commands, or a group of such commands, the command string is always preceded by a special "frame sync" word containing 63 logic 0 bits followed by a logic 1 bit. (See Figure 5-1 for Command Word Structure.)

Title: AE COMMAND LIST

DN- 832-2.2(AE)

Written by: R. Borlik

Date: 20 July 1972

Approved by: B. Stewart

Date: 24 July 1972

REVISIONS

Ltr.	Description	Date	Author
A	Added the command "RSL LOAD MINOR MODE".	1 Aug 1972	R. Borlik
B	Added op codes; revised command terminology to agree with telemetry list; deleted the Command "Telemetry Power Off"; added the commands "H.K. TLM (A) Power Off" and "H.K. TLM (B) Power Off." Combined the commands to fire the SPS AZ and EL Ordnance. Added commands: "Initialize Shunt Limiter Relays", "Reg. Bus Min. Load OFF", "Enable DSAI Power", "Disable DSAI Power".	27 Oct. 1972	R. Borlik
C	Corrected command name for Op Code 544 (Page 7) to DSAI PWR Disable. Sheet 12 - Change command name typo, last line "Initialize Shunt Limiter Relays". Sheet 17 change 9 bit op code for "LEE H.V. #2 ON" to 627.	31 Oct 1972	R. Borlik
D	DSAI code allocations changed. (Page 7) Code 146 connected to PCMC 2. (Page 13)	27 Nov 72	W. V. Fuldner
E	Corrected DSAI Pwr Disable Op-Code (Page 7)	12 Mar 73	W. V. Fuldner
F	Recorrected DSAI Pwr Disable Op-Code (pg. 7) and Corrected CEP Instr. Pwr off Op-Code (pg. 3)	26 Mar 73	W. V. Fuldner
	CONTINUED...

AE COMMAND LIST

This note lists the commands used for AE spacecraft C, D, and E. The 9-bit op codes are coded in octal with the corresponding 2 of 32 codes also listed. Correspondence between the 9-bit and 2 of 32 codes is defined in DN-716-11.1(AE). Commands are transmitted MSB first. As an example, the first command in the list, "DISABLE OAPS" has the 9-bit op code 036₈, which is transmitted as:

000011110
↑
MSB, first bit transmitted

The remaining columns in the table indicate that the command is decoder eleven times on baseplate A as a relay type command and once on baseplate A and twice on baseplate B as a logic level command and is used in spacecraft C, D, and E. Minor mode commands are indicated by asterisks.

In assigning the op codes, the number of bit lines used for a particular system was kept to a minimum as far as possible to reduce the probability of erroneous responses in the event of a bit line failure in the active state. An additional consideration was keeping the loading of the 32 bit lines approximately equal.

A summary of the command op code utilization is given below.

No. of Codes			Where Used
C	D	E	
187	187	185	CDU A only
16	16	15	LIU A only
149	153	147	CDU B only
40	38	40	LIU B only
5	5	5	CDU A and CDU B
2	2	2	LIU A and LIU B

CAPS programmer

LOAD/DUMP COMMAND

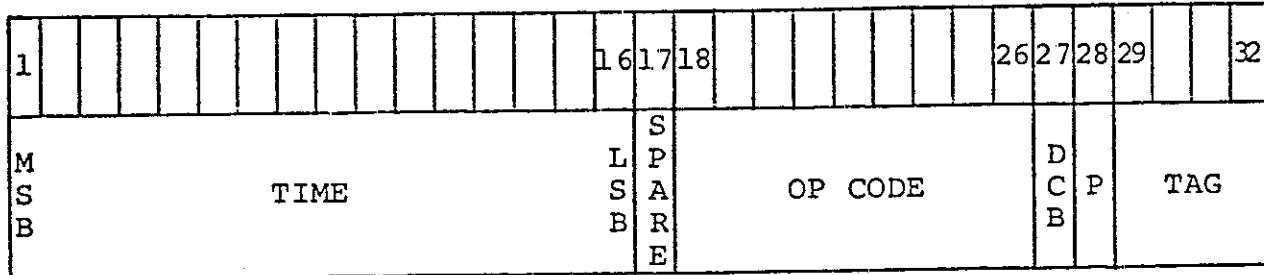

<u>FIELD</u>	<u>BITS</u>	<u>DESCRIPTION</u>
Tag	1-4	Code 0010 specifies a Set Load Command. Code 0001 specifies a Set Dump Command.
Address	5-15	The starting address (in straight binary) for a Load or Dump operation. Valid addresses are 0 through 1023 with bit 5 always set as zero.
Words	16-26	The total number (in straight binary) of 32 bit words to be loaded or dumped. Valid numbers of words are 0 through 1023 with bit 16 always a zero.
Spare	27-32	At present these bits are not being used.

While in the Load Mode, the MP shall increment the Load/Dump address following receipt of any of the three Load Memory commands (see following subparagraphs) starting from the starting address. The MP shall also count the number of 32 bit words loaded (load commands received) and terminate the mode after the specified number of words has been loaded.

3.1.1.1.2.1.2 Load Memory Major Command

The Load Memory Major command will be a minor mode command input to the PROG. The thirty-two bits of minor mode data shall have the following format. (See Figure 3.1.4a also.)

<u>Field</u>	<u>Bits</u>	<u>Description</u>
Time	1-16	This time is the time as measured by the 16 least significant bits of the S/C time code at which the attached OP Code is to be presented to the DEC for execution. The total programmable time is 72 hours, 49 minutes, 4 seconds in 4 second increments.
Spare	17	At present this bit is not being used.
OP Code	18-26	One of the 9 bit codes specifying any of the commands in the S/C glossary.
DBC	27	The Data Bus Control bit must be a "0" if the OP Code is for a major mode command and a "1" if the OP Code is for a minor mode command.
P	28	A Parity bit chosen such that odd parity is maintained over bits 17-28.
Tag	29-32	Bits 29 & 30 of the Tag field shall be loaded into the CMU as "0's" regardless of what is sent. These bits are used internal to the MP as status indicators (see 3.1.1.1.2.3.3.1). Bits 31 & 32 shall be loaded as sent but are presently unused.

While the MP is in the Load mode, the receipt of a Load Memory Major command shall cause the associated minor mode data to be stored in the CMU. The thirty-two bits of data shall be stored in four consecutive 10 bit words in the CMU. The current Load/Dump address shall be used as the ten MSB of the CMU address with the two LSB being 00, 01, 10, and 11 respectively for the four CMU words.

For the Load Memory Major command, the control field (first 2 bits) of each ten bit CMU word shall be loaded as 01. Figure 3.1.4b shows the format for the data as stored in the CMU.

5-33	Size A	Code Ident No. 49671	PS-2271629
			Sheet 23

3.1.1.2.1.3 Load Memory Minor Command

The Load Memory Minor command will be a minor mode command input to the PROG. The thirty-two bits of minor mode data shall have exactly the same format as for the Load Memory Major command except that the DBC bit must be a "1". (See format in Paragraph 3.1.1.2.1.2.)

While the MP is in the Load mode, the receipt of a Load Memory Minor command shall cause the associated minor mode data to be stored in the CMU. The thirty-two bits of data shall be stored in four consecutive 10 bit words in the CMU. The current Load/Dump address shall be used as the ten MSB of the CMU address with the two LSB being 00, 01, 10, and 11 respectively for the four CMU words.

For the Load Memory Minor command, the control field (first 2 bits) of each ten bit CMU word shall be loaded as 10. Figure 3.1.4c shows the format for the data as stored in the CMU.

3.1.1.2.1.4 Load Memory Data Command

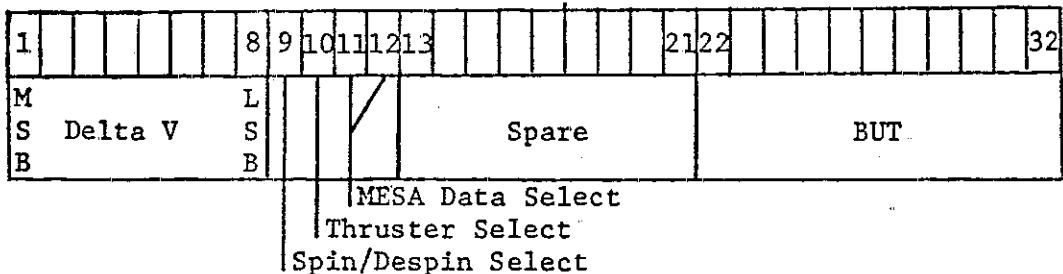

The Load Memory Data command will be a minor mode command input to the PROG. The thirty-two bits of minor mode data will be arbitrary binary data to be sent to the DEC along with an associated minor mode command. See Figure 3.1.4d for the format as sent from the ground.

While the MP is in the Load mode, the receipt of a Load Memory Data command shall cause the associated minor mode data to be stored in the CMU. The thirty-two bits of data shall be stored in four consecutive ten bit words in the CMU. The current Load/Dump address shall be used as the ten MSB of the CMU address with the two LSB being 00, 01, 10, and 11 respectively for the four CMU words.

For the Load Memory Data command, the control field (first 2 bits) of each ten bit CMU word shall be loaded as 00. Figure 3.1.4e shows the format for the data as stored in the CMU.

3.1.1.2.2 Load OAPS Delta Command

The PROG shall accept a Load OAPS Delta minor mode command as input. On receipt of this command, the OP shall enter one of its four active modes. The format for the 32 bits of minor mode data is as follows:

<u>BITS</u>	<u>FIELD</u>	<u>DEFINITION</u>
1-8	Delta V	One of 256 possible binary numbers corresponding to the 256 velocity change increments possible. The programmable range corresponds to Delta V's from zero to 44.11 ft/s.
9	Spin/Despin Select	Code 0 in this bit specifies despun operation of the thruster. Code 1 specifies spinning operation of the thruster.
10	Thruster Select	Code 0 in this bit enables the thrust on/off outputs to the Delta V thruster drivers. Code 1 enables the thrust on/off outputs to the Yaw thruster drivers.
11-12	MESA Data Select	Code 00 selects neither MESA data output. Code 10 selects MESA XY data output. Code 01 selects MESA YX data output. Code 11 is unused but selects neither MESA data output.

<u>BITS</u>	<u>FIELD</u>	<u>DEFINITION</u>
13-21	Spare	These bits are unused at present.
22-32	BUT	These bits are used by the BUT in the LIU; however, they shall also be accepted as part of a good Load OAPS Delta command by the PROG.

After receipt of a valid Load OAPS Delta command the OP shall examine the Spin/Despin select and Thruster select fields of the loaded word to determine which active mode to enter. While this command sets the active mode, no thruster shall be activated by this command and the integration of the acceleration as measured by the MESA shall not be started. The allowed modes and corresponding codes in the select fields are as follows:

Bits: 9 & 10	Mode
0 0	Delta V Despun
1 0	Delta V Spin
0 1	Yaw Despun
1 1	Yaw Spin

The Thrust On command received after a Load OAPS Delta command shall actually turn on the appropriate thrusters and initiate the Delta V comparison. If a new Load OAPS Delta command is received before a Thrust On command, the OP shall accept it and enter the new mode. Once the Thrust On command has been received, however, receipt of a new Load OAPS Delta command shall cause the OP to return to Standby Mode.

Any of the four active modes shall be terminated by receipt of the Disable OAPS command or the BUT overflow signal. Additionally, the Delta V Despun mode shall be terminated when the measured Delta V from the MESA is greater than or equal to the programmed Delta V loaded via the Load OAPS Delta command.

3.1.1.2.2.1 Delta V Despun Mode

While in this mode, the OP shall accept the first Thrust On command which occurs, turn on the two sets of outputs to the Delta V thruster, and start integrating the output of the accelerometer. The OP shall continually compare this measured Delta V with that loaded via the Load OAPS Delta V command which set the mode. When the measured Delta V is greater than or equal to the programmed one, the OP shall return the Thrus-

5-36	Size A	Code Ident No. 49671	PS-2271629
			Sheet 41

ter On/Off outputs to the inactive level and enter Standby mode. This mode shall also be terminated and the OP returned to Standby mode on receipt of the Disable OAPS command or on receipt of the BUT overflow signal.

Receipt of additional Thrust On/Off commands while the Delta V is being measured shall control the Thruster On/Off outputs but shall not interrupt the measurement or comparison of the Delta V.

The selected input from the Miniature Electro-Static Accelerometer (MESA) will be a frequency proportional to the S/C acceleration (see Paragraph 3.1.1.2.10). After receipt of the first Thrust On command in this mode, the OP shall integrate the MESA data to measure the velocity change (Delta V) of the S/C. The integration shall be done by counting the pulses on the selected MESA Data input. The OP shall provide for Delta V in the range of zero feet per second to 44.11 feet per second corresponding to a range of 2^{13} counts to $2^{20}-2^{13}$ counts.

The OP shall continually compare the eight MSB of this accumulated count against the programmed Delta V from the Load OAPS Delta command. The granularity on the programmable Delta V shall be 0.173 feet per second and there shall be 255 uniform steps in the range. The count shall always start from zero on receipt of the first Thrust On command occurring during the Delta V Despun mode and shall continue until a Delta V match is detected or the mode is terminated. The count shall not be reset nor be inhibited by receipt of further Thrust On/Off commands.

3.1.1.2.2.2 Delta V Spin Mode

While in this mode, the OP shall accept the first Thrust On command which occurs, enable the two sets of outputs to the Delta V Thrusters, enable the OAPS Nadir Commutation, and inhibit the Delta V match.

In this mode the Thrust On command enables the outputs to the Delta V Thrusters but the actual turn on and off of the thrusters shall be under control of the OAPS Delta V Nadir Commutation. (See Paragraphs 3.1.1.5.1.7 and 3.1.1.5.1.8) The OP shall receive the commutation signals from the Nadir Programmer (NP) internal to the PROG. After the Delta V thruster outputs are enabled by the Thrust On command, the receipt of OAPS Delta V Nadir 1 shall turn on the Delta V thrusters and the receipt of OAPS Delta V Nadir 2 shall turn them off. This action shall continue until the Thrust Off command disables the thruster outputs or until the mode is terminated by the Disable OAPS command or the BUT overflow signal. Receipt of additional Thrust On/Off commands while in this mode shall enable/disable the Delta V thrust outputs but shall not terminate the mode.

USED BY ARP					USED BY QS									USED BY MS

Programmable MASC Nadir

MASC Commutation On/Off

MASC Minus On/Off

MASC Plus On/Off

Field Control Bit for MASC (Bits 20-32)

QOMAC Minus On/Off

QOMAC Plus On/Off

Field Control Bit for QOMAC (Bits 17-19)

Auto Roll Lower Threshold

Spare

Auto Roll Upper Threshold

Field Control Bit for Auto Roll (Bits 1-16)

For further description of the data in each field and the modes associated with them refer to the paragraphs which specify the appropriate Programmer section.

Thus a real time or stored QOMAC program shall be executed with the polarity reversed from that received by the QS.

3.1.1.3.1.3 QOMAC Inhibit Mode

The QS shall operate in the Inhibit mode when the ARP indicates a measured roll error which is between the loaded lower threshold and upper threshold. In this mode neither the QOMAC Plus On nor the QOMAC Minus On commands shall activate either the QOMAC Coil Plus outputs nor the QOMAC Coil Minus outputs. Thus a real time or stored QOMAC program received by the QS shall not be executed.

3.1.1.3.2 QOMAC Control Commands

Bits 17, 18, and 19 of the Load Attitude Data minor mode command (see Paragraph 3.1.1.6.1.9) shall be used by the QS to control its state or operation. The codes for these bits and the corresponding commands are listed below:

Bits:	<u>17</u>	<u>18</u>	<u>19</u>	Command
	1	0	0	QOMAC Off
	1	1	0	QOMAC Plus On
	1	0	1	QOMAC Minus On
	1	1	1	This code is not allowed--neither coil drive shall be energized
	0	X	X	No new command - state stays the same

X - Don't Care Condition

The QS shall monitor these bits continuously and shall respond to the corresponding commands as described in Paragraph 3.1.1.3.1, depending on the mode set by the ARP. Bit 17, the QOMAC field control bit, must be a "1" to initiate a new QOMAC command.

3.1.1.3.6 MASC Control Commands

Bits 20, 21, 22, and 23 of the Load Attitude Data minor mode command (see Paragraph 3.1.1.6.1.9) shall be used by the MS to control its state. The codes for these bits and the corresponding commands are listed below:

Bits:	<u>20</u>	<u>21</u>	<u>22</u>	Command
	1	0	0	MASC Off
	1	1	0	MASC Plus On
	1	0	1	MASC Minus On
	1	1	1	This code is not allowed--neither coil drive shall be energized.
	0	X	X	No new command - state stays the same.

Bits:	<u>20</u>	<u>23</u>	Command
	1	0	MASC Commutation Off
	1	1	MASC Commutation On
	0	X	No new command - State stays the same.

X - Don't Care Condition

The MS shall monitor these bits continuously and shall respond to the corresponding commands as described in Paragraph 3.1.1.3.5. Bit 20, the MASC field control bit, must be a "1" to initiate a new MASC command.

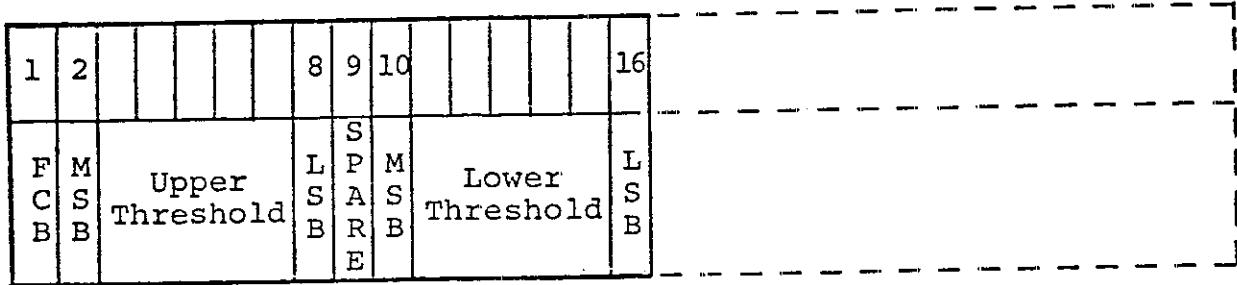

3.1.1.3.7 MASC Coil Plus

The PROG shall provide four identical MASC Coil Plus outputs to the coil drivers in the CDU. These signals shall become active upon receipt of the appropriate MASC Plus On and MASC Minus On commands as described in Paragraph 3.1.1.3.5 depending on the commanded mode. When active, these signals shall cause current to flow in the positive sense in the Enabled MASC Coil(s). These signals shall never be active at the same time that the MASC Coil Minus outputs are active, and shall make all transitions at least 30 milliseconds away

these commands as received by the QMP to provide an automatic turnoff of the ARP active mode.

3.1.1.4.2 Load Auto Roll

Bits 1 through 16 of the Load Attitude Data minor mode command (See Paragraph 3.1.1.6.1.9) shall be used by the ARP to program the upper and lower thresholds. The format for these bits is as follows:

Bits	Field	Definition
1	Auto Roll Field Control Bit	This bit must be a "1" to load new threshold values into the ARP.
2-8	Upper Threshold	A binary number representing the counts of 4096Hz clock corresponding to the desired Earth Time difference for the upper limit of roll error.
9	Spare	This bit is unused at present.
10-16	Lower Threshold	A binary number representing the counts of 4096Hz clock corresponding to the desired Earth Time difference for the lower limit of roll error.

Each time the Load Attitude Data command is received and the AR FCB is a "1", the ARP shall load the new thresholds but shall take no further action. This command shall not turn on the ARP nor shall it change the state of the outputs if the ARP is already on. The thresholds may be changed while the

The following tables delineate the bit allocations for pitch offset and wheel speed bias for the mino mode command used by the pitch control subsystem.

COMMAND VERIFICATION WORD BIT ASSIGNMENTS

I. INTRODUCTION

This design note defines the coding of the command verification and telemetry format identification information contained in word locations 4 and 5 of the telemetry main frame. Bit 1 corresponds to bit 1 of main frame word 4 and is transmitted first in real time. The bit order is reversed on playback of the spacecraft tape recorder.

Bit 1 Load/Dump Error Flag - A logic 1 in this bit will indicate that one of the following errors has occurred in attempting to command the memory and memory programmer.

- I. If the memory programmer is operating in a load mode or in a dump mode, and the memory address counter in the memory programmer overflows, (attempted wrap-around), the error will be flagged. (The memory programmer will not wrap-around.)
- II. If the memory programmer is not in the load mode, and a load memory major, or load memory minor, or load memory data command is received, the error will be flagged. (The command will not be accepted.)
- III. If the memory programmer is in a load mode or in a dump mode and a set load/dump command is received, the error will be flagged. (The command will not be accepted.)

- Bit 2 Stored Command Execution - A logic 1 indicates that a stored command is being executed during the main telemetry frame in which the logic 1 occurs. The command may have been stored in either the Programmer memory or in the MARC.
- Bits 3,4,5 Decoder 1 Status - Bit 3 will normally be a logic 1 indicating that bits 4 and 5 represent new information since the last telemetry frame. If this bit is a logic 0, it indicates that the Decoder telemetry has not been updated since last sampled by the telemetry subsystem, and bits 4 and 5 do not represent new information. This fact is necessary for proper command verification bookkeeping on the ground. Bits 4 and 5 indicate state of DEC real time command logic as follows:
- Bit 4/Bit 5
- | | |
|----------|--|
| 0 0 | Squelch State - Command clock amplitude below threshold or DEC phase locked oscillator not in phase with received clock signal. Neither commands nor frame sync will be accepted by DEC in this state. |
| 1 0 | Sync Search - Decoder is in condition to accept the frame sync pattern. |
| 1 1 | Address Check - Frame sync has been recognized and Decoder will accept a command with valid address. This state always occurs once immediately after frame sync is received. |
| 0 1 | Execute - This state indicates that a valid command has been received and will be executed. |
- Bits 6,7,8 Decoder 2 Status - Bits 6, 7, and 8 are identical in function to bits 3, 4, and 5, respectively.

Bits 9 & 10 PCMC 1 Status - Bits 9 and 10 indicate the mode of the PCMC which formatted the telemetry data.

Bit 9/Bit 10

- | | | |
|---|---|---|
| 0 | 0 | Power off. |
| 1 | 0 | MARC Mode - Telemetry format under control of MARC. |
| 0 | 1 | ROM Mode - Telemetry frame in standard format defined by read-only memories contained in PCMC. |
| 1 | 1 | Memory Dump Mode - Telemetry format is standard as in ROM mode, except that 32 words in the telemetry main frame contain data from the command memory in place of the normal experiment data. |

Bit 11 Bad Sequence Flag - If this bit is a logic 1, it indicates that one of two abnormalities was detected by the format checking logic of the memory Programmer.

- I. During memory load, signifies either that
 - (a) a Load Memory Major or Minor command is received when Load Memory Data command is expected following a Load Memory Minor command, or
 - (b) a Load Memory Data command is received when not expected, that is, whenever the previous load command was not Load Memory Minor, or
 - (c) the memory Programmer left the load mode after receiving a Load Memory Minor, but before receiving a Load Memory Data command.

- II. While in PROGRAM mode, signifies that a stored minor mode command op code was transferred to the Decoder, but not executed because the stored control fields read out of memory with the minor mode data were not all correct.

Bits 12-16 Check Bits - These bits are parity check bits which provide a check over all bits except bit 1.

G	Added Memory -10V TLM to Word (66,121) pg. 11	20 Nov 73	W. V. Fuldner

AE-C, D, E SPACECRAFT TELEMETRY DATA FORMAT**1.0 INTRODUCTION**

This design note presents the telemetry format for the spacecraft telemetry contained in the following main frame locations:

1. Words 4 & 5; Command Verification and Frame Identification
2. Word 20; SPS/EUVS eight word analog subcom
3. Words 17 & 18; Attitude information four word subcom
4. Word 65; Spacecraft housekeeping sixty-four word subcom
5. Word 66; Spacecraft housekeeping one hundred twenty-eight word subcom
6. Word 81; Body rotation time reference
7. Word 82; Sun angle time reference
8. Words 119 & 120; MESA/RSL four word subcom

Also included in the attached tables are the formats for the experiment flag bits which are assembled by the spacecraft for the experiment 128 word subcom.

Attached in Appendix A is the NASA supplied main frame telemetry format and experiment subcom formats which are understood to be the mission requirements for the AE-C spacecraft. Note that in the experiment 64 word subcom, word 21 is now an analog for the C magnetometer and word 23 is a digital spare.

Note that in spacecraft flag word 46 of the 4 sec spacecraft subcom, bits 4 thru 8 originate on the B baseplate while the flag bit multiplexer used is located on the A baseplate. Thus, these spare relay flag bits from CDU-B are taken across the baseplate to baseplate interface when they are used in the system.

The A or B indication in the upper right hand corner indicates the baseplate on which the source circuit is mounted. The notation in the lower right hand corner identifies the Analog (and polarity) or Digital nature of the signal.

Appendix B contains the memory dump format.

Included in Appendix C are the main frame and experiment subcom frames for the AE-D spacecraft. The word locations shown shaded indicate the changes in the formats from the C spacecraft which require modification to the PCMC Read-Only-Memory, and require additional circuitry in the appropriate LIU's to permit the LIU designs to be interchangeable between to either the C, D, or E spacecraft. Appendix D contains the AE-E main frame and subcom frame formats. With the exception of the magnetometer telemetry, these frames are subsets of the corresponding frames for the AE-C spacecraft. As the system design permits either the analog magnetometer (C) or the digital magnetometer (D), either format is hardware available from the LIU. If it is acceptable to utilize the analog version for the E spacecraft word locations, then the Read-only-Memories of the PCMC for the C spacecraft may be used for the E spacecraft. In all conditions, the overwritten locations for the memory dumps are the same and the spacecraft telemetry locations are the same.

The following tables present the spacecraft telemetry for the AE-C, D, E spacecraft.

Angle in degrees $\pm .5^\circ$
from spacecraft X-Y
plane

For the sun in -Z hemisphere, bit l=1 and angles above as shown.

For the sun in +Z hemisphere, bit l=0 and angles above negated.

Post-interrogate pattern: 1 0 1 0 1 0 1 0

SECTION 8.0

TEMPERATURE TELEMETRY

The following table and figures identify the spacecraft temperature telemetry points. Note that the items appearing without an accompanying telemetry word number were used for external instrumentation during the AE-C Thermal Balance Test and are not available in the spacecraft 8 second SUBCOM.

RF SYSTEMS

AE-C has a complement of a Dual S-Band Transponder, two VHF transmitters, an RF switch for VHF, an S-band belt antenna and associated power splitter and a VHF whip antenna and associated cables. The Transponder is modulated by a Dual Premodulation Processor. Manufacturer and serial numbers of these units are given in the following tabulation.

Unit	Serial Number	Manufacturer
Transponder	01P	Motorola
VHF Transmitter #1	01P	RCA/Limited
VHF Transmitter #2	02	RCA/Limited
Belt Antenna		Ball Brothers Research Corp.
Power Splitter		Ball Brothers Research Corp.
RF Switch		RCA/AED
VHF Antenna		RCA/AED
PMP		Vector

A summary of key transponder parameters is presented in the table below.

Parameter	Side 1	Side 2
Receiver Frequency	2108.2479 ^{+0.0021} _{-0.0015} MHz	2108.2471 ^{+0.0019} _{-0.0014} MHz
Receiver Sensitivity	-113.9 ^{+2.7} _{-1.6} dBm	-113.7 ^{+2.9} _{-2.0} dBm
Ranging Delay*	1008.7 ^{+15.3} _{-13.8} ns	998.0 ^{+20.1} _{-20.8} ns
Transmitter Frequency		
AUX OSC	2289.4905 ^{+0.0035} _{-0.0045} MHz	2289.4862 ^{+0.0078} _{-0.0102} MHz
VCXO	2289.502 ^{+0.008} _{-0.012} MHz	2289.496 ^{+0.004} _{-0.006} MHz
Carrier Level	Low Power Mode +29.2 ^{+0.5} _{-1.0} dBm High Power Mode +35.8 ^{+0.9} _{-0.5} dBm	+29.2 ± 1.2 dBm +36.2 ^{+0.8} _{-0.4} dBm
Transmitter Mod Index		
GRARR (Uplink Mod = 1 radian, 70kHz sinusoid)		
Sideband/ Carrier Level	-11.0 ⁺⁰ _{-0.2} dB	-11.4 ± 0.1 dB
PRN (Uplink Mod = 0.38 radian, 496kHz square wave)		
Sideband/ Carrier Level	-18.0 dB	-18.0 dB

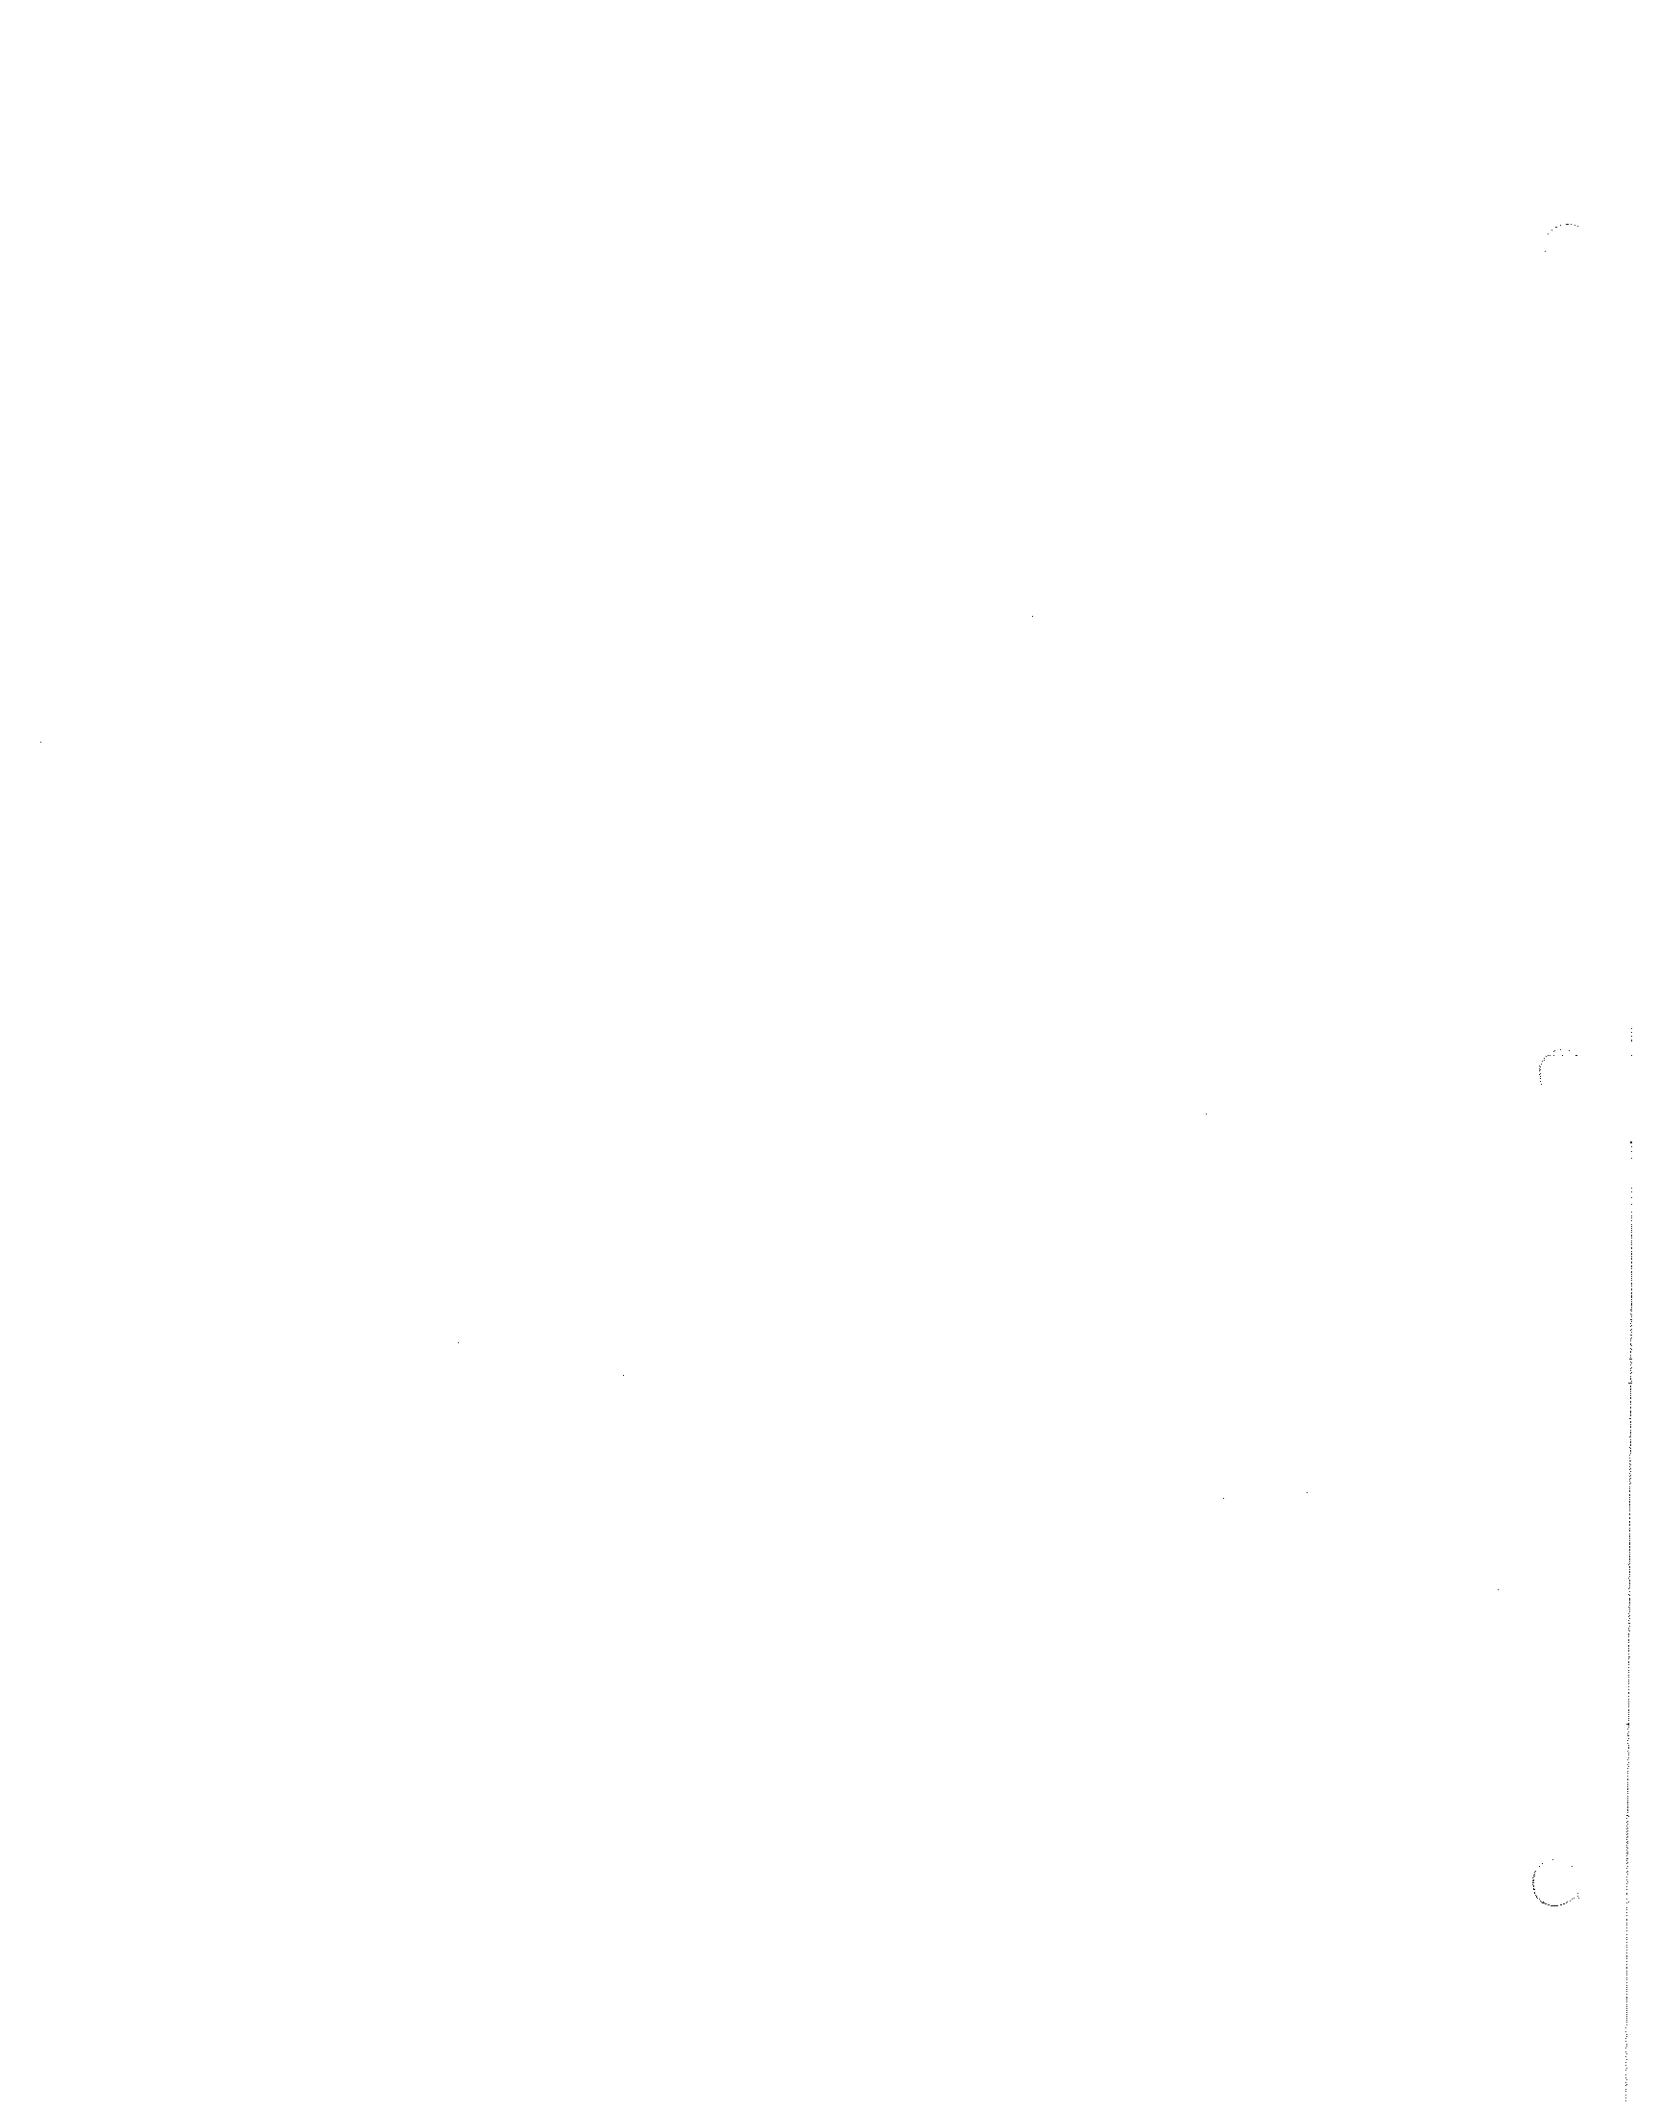

* Variation shown includes effects of +5° to +35° temperature range, ± 90kHz doppler and -95dBm to -55dBm signal strength

Parameter		Side 1	Side 2
Transmitter Mod Index (Cont.)			
Real Time			
<u>1024kHz/Carrier</u>			
with PMP 1		-3.0 ^{+0.1} _{-0.2} dB	-3.1 ± 0.1 dB
with PMP 2		-3.2 ^{+0.2} _{-0.4}	-2.8 ^{+0.1} _{-0.2} dB
Playback			
<u>1024kHz SB/Carrier</u>			
with PMP 1		-12.1 ± 0.3 dB	-12.0 ^{+0.2} _{-0.0} dB
with PMP 2		-12.1 ± 0.3 dB	-11.8 ± 0.2 dB
<u>768kHz SB/Carrier</u>			
with PMP 1		-3.4 ^{+0.2} _{-0.4} dB	-3.4 ⁺⁰ _{-0.1} dB
with PMP 2		-3.3 ± 0.3 dB	-3.1 ± 0.1 dB

A summary of key VHF Transmitter parameters is presented below.

Parameter	Side 1	Side 2
Carrier Frequency	137.2295 ^{+0.0015} _{-0.0005} MHz	137.2300 ^{+0.0010} _{-0.0003} MHz
RF Power - Beacon Mode	+26.3 ± 0.3 dBm	+25.8 ^{+0.5} _{-0.4} dBm
RF Power - TLM Mode	+31.3 ^{+0.4} _{-0.2} dBm	+31.5 ^{+0.3} _{-0.2} dBm
<u>Modulation Index</u>		
Carrier Drop with Mod	-2.6 dB	-3.1 dB
16kHz Sideband Below Carrier	-4.4 dB	-3.6 dB

SECTION 12.0

POWER SUBSYSTEM

The AE-C Power Subsystem consists of an upper and lower Solar Array with integral shunt dissipating elements, a Power Supply Electronics Unit containing redundant -24.5V regulators and battery conditioning equipment and three 6 Ampere-hour capacity batteries. Unit serial numbers are listed below.

Upper Solar Array	--	001
Lower Solar Array	--	001
Power Supply Electronics	--	001
Battery #1	--	001
Battery #2	--	002
Battery #3	--	003

POWER SUBSYSTEM OPERATING PARAMETERS
